

SENTINEL

User Guide

A simple guide to screening names with SENTINEL. This document explains what the tool does, how to use it, and how to understand your results.

Version	1.0 - August 2026
Audience	SENTINEL users

Contents

1	What SENTINEL is	Overview and watchlists covered
2	Getting started	Opening the app and first steps
3	Day-to-day use	Single search, bulk screening, sidebar
4	Understanding your results	Verdicts, reports, and re-screenings
5	Troubleshooting	Common questions and quick fixes

1. What SENTINEL is

SENTINEL is a web-based tool that checks a name - or a list of names - against eight official international watchlists. It flags any names that could be linked to a listed entity, so you can see at a glance who needs a closer look.

Watchlists covered

- OFAC SDN and Non-SDN lists (US Treasury)
- United Nations Consolidated List
- Australian DFAT Consolidated List
- Singapore MAS Designated Lists and Enforcement Actions
- SG TSFA First Schedule (Singapore Terrorism (Suppression of Financing) Act)
- MAS Investor Alert List (unlicensed entities flagged by MAS)

The underlying list data is pulled live from the official public sources and refreshed automatically, so screening always runs against the latest available information.

2. Getting started

Opening the app

Open the app link in any modern web browser (Chrome, Edge, Safari or Firefox). No special software or training is needed - everything runs in the browser.

A quick note on your first screen

The app opens with an Individual Search tab, a Bulk Screening tab, a Data Status tab, and a sidebar showing the health of the watchlists.

3. Day-to-day use

Single search

Type a name on the Individual Search tab and press enter. SENTINEL returns a verdict, the closest matches, and a downloadable PDF of the findings.

Bulk screening

Upload a spreadsheet (Excel, CSV or JSON), select the column that contains the names, and run the screening. The app shows a summary table and three download options:

- Full Report (PDF) - one page per screened name
- Results (CSV) - the summary table
- Match Details (XLSX) - every match found, with source and confidence

The sidebar

The sidebar shows how fresh each watchlist is, a Refresh Data Now button, and settings for the screening threshold, phonetic matching, and the name shown on reports.

4. Understanding your results

What the verdicts mean

- FLAGGED - a strong match was found. Review this carefully.
- POTENTIAL - a possible match. Worth a closer look.
- CLEAR - no match was found.

Your reports

Every screening produces reports you can download and keep. Each report records which data version was screened against, so results can always be traced back to the lists in force at the time.

Re-screening

If you need to screen a new batch of names or re-run an old one, simply upload the updated file and run the screening again. The process is the same each time.

5. Troubleshooting

- Download buttons can take a few seconds to appear on large batches - this is normal, not an error.
- If the watchlists look stale, check the sidebar status and use Refresh Data Now to re-pull the latest data.
- If a source is temporarily unavailable, the app falls back to its last snapshot and labels that list 'cached'.
- If anything looks wrong, keep the name and date you screened - every result can be traced to the data version in force.
